3. Dimming Software Function Instruction

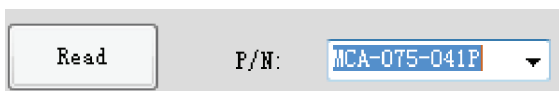

• Communication Setup

Connect Status: **Disconnected**

Click "Connect" to set up the link between the computer and the USB dongle.

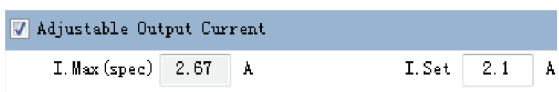

• Driver Identification

Read P/N: **MCA-075-041P**

Click "Read" to identify the driver, then fill in the part number and max current automatically.

• Adjustable Output Current (AOC)

☒ Adjustable Output Current

I. Max(spec) **2.67** A I. Set **2.1** A

Click ON "☒" to activate the output current configuration, I. Max(Spec) is filled in automatically during identify driver, I. Set can be filled in any value lower than I. Max(spec).

• Dimming Selection and Setting

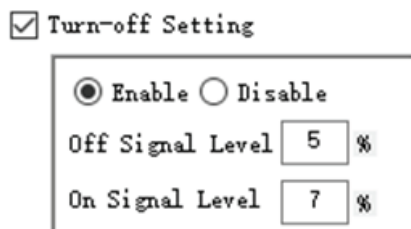

☒ Dimming Selection and Setting

☒ Cable Dimming ☐ Time Dimming ☐ No Dimming

Click ON "☒" to activate the dimming selection and setting, or else no update during current setting. Choose one of the control method listed below to go with, then the related setting interface will appear.

• Turn-Off signal setting

☒ Turn-off Setting

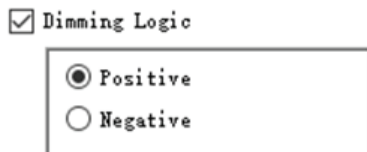

☒ Enable ☐ Disable

Off Signal Level **5** %

On Signal Level **7** %

Click ON "☒" to activate the turn-off function configuration. Choose "enable" or "disable", and set the turn on and off dimming signal when "enable" selected. In turn off status, the driver will output minimum output voltage, please make sure the LED lamp can be turned off when applied with this level voltage.

• Dimming Logic

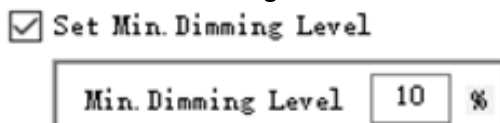

☒ Dimming Logic

☒ Positive ☐ Negative

Click ON "☒" to activate the dimming logic configuration, default setting is "Positive" logic, it means the output current will increase with the dimming signal level up; and "Negative" logic will decrease the output current with dimming signal level up.

• Set Minimum Dimming Level

☒ Set Min. Dimming Level

Min. Dimming Level **10** %

Set the minimum dimming output current, default setting is 10%

• Dimming Signal Configuration

☒ Configure Dimming Signal

Signal Voltage setting:
0-10V

Compliant with analog and PWM signal:
1) Analog: 0-10V
2) PWM: Low level-0V, High Level-10V

Click ON "☒" to activate dimming signal configuration, the dimming signal can be analog or PWM signal, here to set the value of the high level of these two signals, the setting can be:

0-3.3V, 0-5V, 0-9V, 0-10V

For example, if 0-10V is selected, the dimming signal will be:

- 1.) Analog: 0-10V.
- 2.) PWM: Low level-0V, High Level-10V.

This graph presents how the output current will react to the dimming signal, including analog and PWM dimming signal.
